POWERBI\_BI\_DAILY\_NOTE 09/12/2025

# **POWER QUERY**

- 1. **Power Query** is a data connection and transformation tool in Microsoft products like Power BI, Excel, and Dataverse.
- 2. It helps you **import, clean, reshape, and combine** data from multiple sources before loading it into your reports or models.

# Where is it used:

- 1. **Power BI**  $\rightarrow$  Data preparation before creating dashboards.
- 2. **Excel**  $\rightarrow$  Clean raw data, remove duplicates, merge sheets, etc.
- 3. **Dataverse & other apps**  $\rightarrow$  Automate data shaping.

# **Key Features:**

- 1. Connect to many sources (Excel, CSV, SQL, APIs, Web, etc.).
- 2. **Transform data** without coding (filter, merge, pivot/unpivot, split, add columns, etc.).
- 3. **M language** (behind the scenes, Power Query generates "M" code).
- 4. **Repeatable process** once steps are applied, you can refresh, and it redoes everything automatically.

# **Example Use Case:**

- 1. Import sales data from multiple CSV files.
- 2. Remove duplicates.
- 3. Split "Full Name" into "First Name" & "Last Name".
- 4. Merge with product details from another table.
- 5. Load the cleaned dataset into **Power BI visuals** or **Excel pivot tables**.

POWERBI\_BI\_DAILY\_NOTE 09/12/2025

# **Power Query Step by Step:**

- 1. Open Power Query:
- In Power BI Desktop  $\rightarrow$  Go to Home  $\rightarrow$  Transform Data  $\rightarrow$  Transform.
- In Excel  $\rightarrow$  Data  $\rightarrow$  Get Data  $\rightarrow$  Launch Power Query Editor.

You'll see a new window called **Power Query Editor**.

#### 2. Connect to Data Source

Example: Import a CSV file.

- Click Home  $\rightarrow$  New Source  $\rightarrow$  CSV.
- Choose your file  $\rightarrow$  data preview appears.

## 3. Apply Transformations (Clean & Shape Data)

Here are the most common transformations:

#### **Remove Unwanted Columns**

• Right-click on a column  $\rightarrow$  **Remove**.

#### **Rename Columns**

• Double-click the column name  $\rightarrow$  rename it (e.g., "Cust ID"  $\rightarrow$  "Customer ID").

#### Filter Data

• Use filter dropdown (like Excel)  $\rightarrow$  e.g., only keep rows where **Sales** > **1000**.

## Split Column

- Select a column  $\rightarrow$  **Split by Delimiter** (e.g., split "Full Name"  $\rightarrow$  First Name, Last Name).
- Merge Queries (like SQL JOIN)
- Home  $\rightarrow$  Merge Queries  $\rightarrow$  choose common column (e.g., Customer ID)  $\rightarrow$  join two tables.
- **Append Queries (like SQL UNION)**
- Home → Append Queries → combine two datasets with same columns.

POWERBI\_BI\_DAILY\_NOTE 09/12/2025

## Pivot / Unpivot

- **Transform**  $\rightarrow$  **Pivot** Column  $\rightarrow$  make row values into columns.
- Unpivot  $\rightarrow$  opposite (convert columns into row values).

# 4. View Applied Steps

On the right side, you'll see **Applied Steps**  $\rightarrow$  Power Query records every change. (Like a **recipe**: remove column  $\rightarrow$  rename  $\rightarrow$  merge  $\rightarrow$  filter).

#### 5. Load Data

- Once transformations are done → Home → Close & Load (Excel) or Close & Apply (Power BI).
- Now cleaned data is ready for **Pivot Tables** (Excel) or **Reports & Dashboards** (Power BI).

After applying Power Query, you'll have a cleaned table ready for analysis.
